Expert Fitting Recommendations
Sportsman and Endurance Series lenses are typically fitted using distance-centering. When the head and body are in a natural posture and the gaze is straight ahead, the centering marks should align with the pupils. Since most sports prioritize distance vision, we recommend selecting the lowest possible reading addition for optimal clarity. Provide real measurements, without preferential adjustments.
Here you will find the form requested to provide along with the prescription data to ensure lens are manufactured and framed in their correct position. Please consult your trusted optician.
